And grocery stores make use of small models to drop supplies in the aisles. Whether transporting lumber at a sawmill or loading material at a construction site, operators of forklifts are needed to be trained well and licensed. The priority should be on pedestrian and worker safety. This lift truck training course teaches the health and safety regulations governing forklifts to be able to guarantee their efficient and safe operation.

Forklift Training Program Safety Guidelines:

Proper training guarantees that operators of forklifts could maintain control of the forklift throughout tilting, traveling and lifting. Just trained operators should operate a forklift.

Safety tips when traveling - head, hands, arms, feet and legs should be kept inside the forklift truck during traveling. The forks must be tilted back and low to the ground. Observe posted traffic signs. Decrease speed and honk the horn if taking a corner. If the vision of the driver is blocked by the load, drive in reverse slowly. Pre-inspect the ground for potential dangers, like wet or oily spots, objects, rough patches, holes, vehicles and people. Prevent sudden stops.

If pedestrians pass across the vehicle or moves into a blind spot, the forklift should be stopped, the load lowered, waiting until the path is clear. If a load is being transported on an incline, the forks should be pointed downhill without a load and uphill with a load. The forklift must only be turned around if on level ground.

Safety guidelines while steering - If traveling at good speeds, never turn the steering wheel sharply. Support the load making use of the front wheels and turn utilizing the rear wheels. A truck that is overloaded will be difficult to steer. Adhere to load limits. Never add a counterweight in order to improve steering.

Safety tips while loading - Follow the recommended load and capacity limitations of the forklift. This information is displayed on the data plate. Always make sure that the load is positioned based on the recommended load centre. The forklift would remain steady as long as the load is kept close to the front wheels.

The mast of the forklift must be in an upright position prior to inserting the fork into a pallet. Prior to inserting the fork, level it.
